Notices

Knowledge and best practice in this field are constantly changing. As new research and experience broaden our understanding, changes in research methods, professional practices, or medical treatment may become necessary.

Practitioners and researchers must always rely on their own experience and knowledge in evaluating and using any information, methods, compounds, or experiments described herein. In using such information or methods they should be mindful of their own safety and the safety of others, including parties for whom they have a professional responsibility.

With respect to any drug or pharmaceutical product identified, readers are advised to check the most current information provided (i) on procedures followed or (ii) by the manufacturer of each product to be administered, to verify the recommended dose and the method and duration of administration, and contraindications. It is the responsibility of practitioners, relying on their own experience and knowledge of their patients, to make diagnoses, to determine dosages and the best treatment for each individual patient, and to take all appropriate safety precautions.

To the fullest extent of the law, neither the Publisher nor the authors, contributors, or editors, assume any liability for any injury and/or damage to persons or property as a matter of products liability, negligence or otherwise, or for any use or operation of any methods, products, instructions, or ideas contained in the material herein.

Foreword

Echocardiography is a core component of every aspect of clinical cardiology and now plays an essential role in daily decision making. Both echocardiographers and clinicians face unique challenges in interpretation of imaging and Doppler data and in integration of these data with other clinical information. However, with the absorption of echocardiography into daily patient care, there are some voids in our collective knowledge base. First, clinicians caring for patients need to understand the value, strengths, and limitations of echocardiography relevant to their specific scope of practice. Second, echocardiographers need a more in-depth understanding of the clinical context of the imaging study. Finally, there often are unique aspects of data acquisition and analysis in different clinical situations, all of which are essential for accurate echocardiographic diagnosis. The books in the Practical Echocardiography Series are aimed at filling these knowledge gaps, with each book focusing on a specific clinical situation in which echocardiographic data are key for optimal patient care.

In addition to *Intraoperative Echocardiography*, edited by Donald C. Oxorn, MD, other books in the series are *Echocardiography in Congenital Heart Disease*, edited by Mark Levine, MD, and Karen Stout, MD; *Echocardiography in Heart Failure*, edited by Martin St. John Sutton, MBBS, FRCP, FASE, and Susan E. Waggoner, MD, FASE; and *Advanced Approaches in Echocardiography*, edited by Linda Gillam, MD, and myself. Information is presented as concise bulleted text accompanied by numerous illustrations and tables, providing a practical approach to data acquisition and analysis, including technical details, pitfalls, and clinical interpretation, supplemented by web-based video case examples. Each volume in this series expands on the basic principles presented in the *Textbook*

of Clinical Echocardiography, Fourth Edition, and can be used as a supplement to that text or can be used by physicians interested in a focused introduction to echocardiography in their area of clinical practice.

With advances in cardiac surgery and interventional cardiology, echocardiographic monitoring and guidance of therapeutic procedures has become an essential element in the procedure itself. These echocardiographic studies often are appropriately performed and interpreted by the anesthesiologist in conjunction with real-time review by the cardiac surgeon or interventional cardiologist. Other cardiologists and cardiac sonographers also often are asked to assist with imaging during these procedures. The optimal use of echocardiographic data in this setting requires specialized knowledge, as summarized in this book on intraoperative echocardiography.

The editor of this volume, Donald C. Oxorn, MD, is a Professor of Anesthesiology at the University of Washington Medical Center, where he is a key part of the echocardiography team in the operating room and interventional cardiology laboratory. He also is an Adjunct Professor of Medicine in recognition of his substantial clinical and teaching contributions in the Division of Cardiology. In this book, *Intraoperative Echocardiography*, Dr. Oxorn has built upon his extensive clinical experience and skills as an educator, along with the expertise of the chapter authors, to produce a truly practical guide to this area of clinical competence. This book introduced me to several new concepts in procedural imaging, as well as filling in many details about the use of echocardiography in the operating room. I hope you learn as much as I did.

Catherine M. Otto, MD

Preface

As the complexity of cardiac surgery and invasive cardiology has increased, so has the reliance on skilled interpretation of periprocedural echocardiography. As well as having a detailed knowledge of the pathophysiology of each disease process, the operative techniques available, and the validity of imaging information, the echocardiographer must be expert at knowing what information is critical, and the most expeditious way of obtaining it.

Intraoperative Echocardiography is one of four volumes contained within the Practical Echocardiography Series. Whereas most other textbooks of intraoperative echocardiography present an extensive review based on a detailed search of the literature, the focus in the current volume is practical aspects of image acquisition and interpretation in the operating room. The book is organized into 12 chapters covering all aspects of intraoperative echocardiography, including the aortic, mitral, tricuspid, pulmonic, and prosthetic heart valves; the pericardium; the aorta, and the right and left ventricles; as well as cardiac masses. In addition, chapters are dedicated to specialized procedures such as heart and lung transplantation, the surgical treatment of congenital heart disease, the complimentary technology of epicardial and epiaortic ultrasound, and intracardiac and intravascular devices, which are seen with increasing frequency both in the operating room and interventional suites.

The goal of this book is to provide content as concise text in a visually rich volume

complimented by online video and case presentations. In each chapter, background information is followed by a step-by-step approach to patient examination. Information is conveyed in bulleted points, with each set of major principles followed by a list of key points. Potential pitfalls are identified and approaches to avoiding errors are provided. Data measurement and calculations are explained with specific examples. Numerous illustrations with detailed figure legends demonstrate each major point and guide the reader through the teaching points.

This atlas will be of interest to all health care providers involved in the acquisition and interpretation of periprocedural echocardiograms. In addition to cardiac anesthesiologists, this book will be useful to cardiologists and cardiology fellows interested in expanding their knowledge of cardiac surgery and the important aspects of intraoperative imaging, cardiac sonographers who wish to participate as part of the intraoperative team, cardiac surgeons seeking to understand echocardiography, and individuals wishing to become more familiar with what actually transpires in the operating room.

This atlas is not a substitute for formal training in TEE performance and interpretation; instead it is designed to serve as an adjunct in furthering the skill required in the obtaining of relevant information critical for successful intraoperative interventions.

Donald C. Oxorn, MD

Acknowledgments

I wish to acknowledge the contributions and encouragement of my colleagues in Cardiothoracic Anesthesiology: T. Andrew Bowdle, Krishna Natrajan, Jorg Dziersek, Peter von Homeyer, Stefan Lombaard, Kei Togashi, Srdjan Jelacic, Erin Failor, and Sally Barlow; in Cardiothoracic Surgery: Edward Verrier, Gabriel Aldea, and Nahush Mokadam; and Starr Kaplan for her artwork. My appreciation extends to Natasha Andjelkovic at Elsevier and the production team who supported this project and helped make it a reality.

I would also like to acknowledge the guidance and encouragement provided by Catherine R. Otto in the preparation of this volume.

Finally, I wish to thank my wife Susan Murdoch and my children, Jonathan Oxorn, Sean Murdoch-Oxorn, and Alexandra Murdoch-Oxorn; their understanding and cheerful disposition was ever present and much appreciated.

I would like to thank two individuals from the University of Toronto: my friend and mentor Gerald Edelman, and Sam Joyner, my first and foremost teacher in echocardiography.

Contents
